## 一、公司介绍/Company Introduction

苏州众为光电有限公司是一家以生产光通讯高端光学薄膜产品为主的高科技公司。公司项目团队具有鲜明的技术特色和优势，核心成员均具有较强的专业知识背景、视野开阔、经验丰富，分别在工艺优化、产品设计、销售等方面拥有很强的专业背景。公司专注于光学薄膜产品的制造与服务，致力成为光学薄膜滤光片的全球领导者之一。

Suzhou Zhongwei Photonics Co., Ltd. is a high-tech company specializing in the production of high-end optical film products for optical communication. The project team of the company has distinct technical characteristics and advantages, and the core members all have strong professional background, broad vision, rich experience, and have strong professional background in process optimization, product design, sales and other aspects. The company focuses on the manufacturing and service of optical thin film products, and is committed to become one of the world leaders in optical thin film filters.

### GFF 介绍

增益平坦滤光片 (Gain Flattening Filter) 简称 GFF。通常, GFF 与增益放大器一起使用, 以确保放大通讯通道都具有相同的信号增益。GFF 的特征在于它们的“峰-峰误差函数”(Peak to Peak Error Function: PPEF), 它用来衡量 GFF 光谱特性与期望的目标曲线的接近程度。众为制造的 GFF 能对付最具挑战性的参数要求。

Gain Flattening Filter(GFF) is usually used in conjunction with EDFA to ensure that the amplification communication channels all have the same signal gain. GFFs are characterized by "Peak to Peak Error Function" (PPEF), which measures how close the spectral properties of the GFF are to the desired target curve. The custom-built GFF is designed to handle the most challenging parameter requirements.

众为的独特设计和镀膜技术成就了超越传统的增益平坦滤光片 GFF, 可以覆盖过去二十年所出现的数百种不同目标曲线的 GFF, 从简单的抛物线形状到非常困难的具有高调制深度和陡峭斜率的形状。此外, 众为的 GFF 设计还提供可以附加类似带通滤光片功能的 GFF。例如, GFF 可以用来阻隔泵浦激光源, 使得光放大器不再需要额外的滤光片。

Our unique design and coating technology allow us to go beyond the traditional gain flat filter GFF to cover hundreds of different target curves that have emerged over the past two decades, from simple parabolic shapes to very difficult shapes with high modulation depths and steep slopes. In addition, Zhongwei's GFF design also provides a GFF that can be attached with functions similar to a bandpass filter. For example, the GFF can be used to block the pumped laser source, eliminating the need for additional filters for optical amplifiers.

## GFF 的参数定义

**ILmin(dB):** 目标 GFF 曲线中的最小插损。

**ILmin or ILex:** Peak insertion loss is the value of maximum transmission within a specified range.

**ILtgt(dB):** 目标 GFF 曲线中的插损。

**ILtgt(dB):** Insertion loss in target GFF spectrum as specified.

调制深度定义为在目标 GFF 曲线中波长范围内的最大插损与最小插损之间的差值。

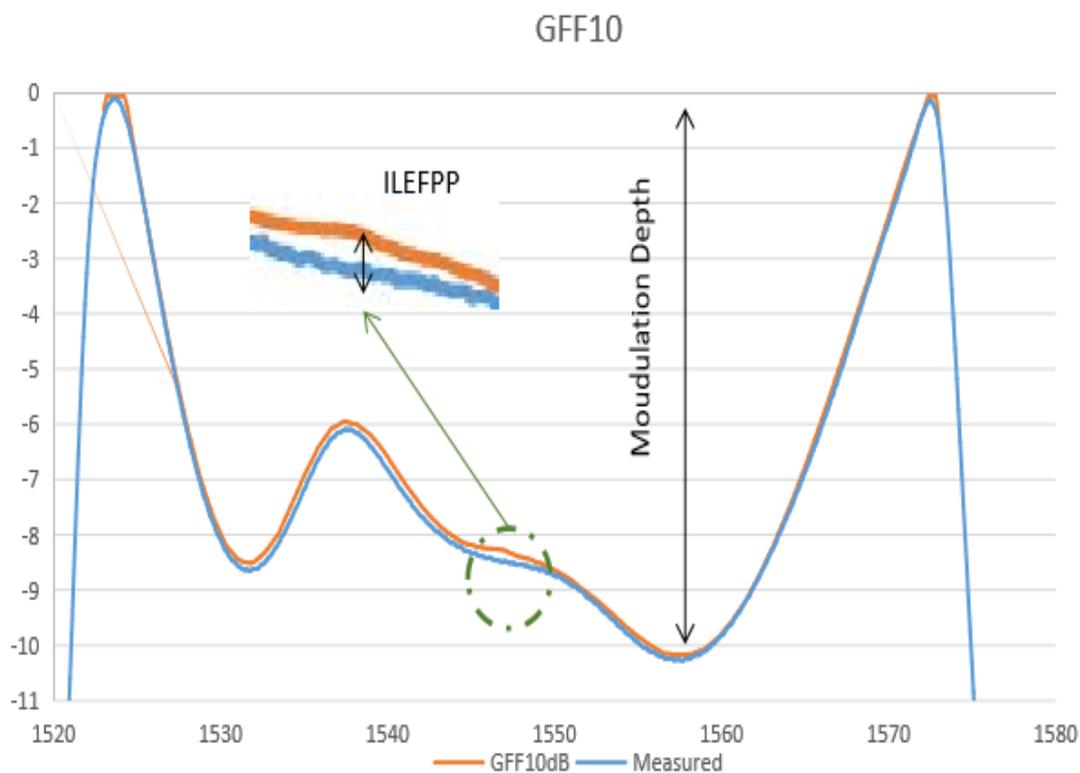

The modulation depth is defined as the difference between the maximum transmission (TMax) [dB] and the minimum transmission value (TMin) [dB] within the target GFF spectrum.

**Error Function 误差函数 (dB):** 目标曲线对应波长的实测 IL 与目标 ILtgt 和 ILmin 之间的差值定义了误差函数 (EF), 即,  $EF(dB) = IL - ILmin - ILtgt$

**Error Function:** The difference between the measured (TMeasured) [dB] and target (TTarget) [dB] transmittance points on the gain equalizing curve defines the error function (EF).

**峰-峰误差函数 (PPEF / EFp-p):** 定义为最大误差函数 (EF 最大值) 和最小误差函数 (EF 最小值) 之间的差值, 即,  $EFp-p = \max(EF) - \min(EF)$

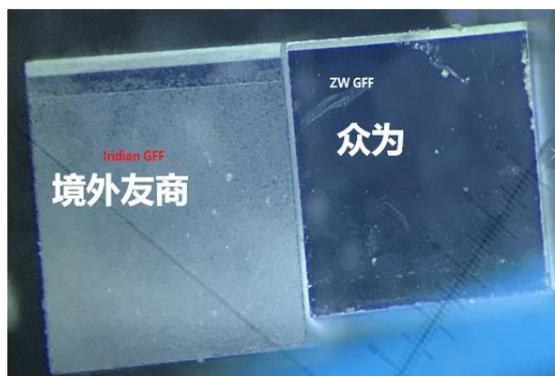

The peak-to-peak error function (PPEF) is a single valued specification defined as the difference between the maximum error function (EFmax) and the minimum error function (EFmin).
